**TOPIC TAGS:** cold welding, spot welding, metal treatment, metal impurity, metal powder, aluminum base alloy, aluminum welding, copper welding

**ABSTRACT:** This article presents the results of investigations concerning the development of a method of cold spot welding which does not require special surface treatment of the metal and which is relatively insensitive to impurities. A layer of iron, sand, emery, nickel, or aluminum powder was applied to the surface of aluminum and copper specimens 3X30X80 mm in dimensions. It was determined from these tests that the powder must be harder than the specimens being welded, and that powder from reduced iron produced the best results. The effect of the particle size of the powders was also investigated. As shown in Fig. 1 of the Enclosure, increasing the dimensions of the powder particles in-

shown in Fig. 1 of the Enclosure, increasing the dimensions of the powder particles increases the strength of the welded spot to a certain limit, after which subsequent en-

TITLE: Investigation of phase and structural transformations in metals and alloys with the aid of exoelectron emission

SOURCE: Moscow. Aviatsionnyy tekhnologicheskii institut. Trudy, no. 66, 1966. Struktura i svoystva aviatsionnykh staley i splavov (Structure and properties of aircraft steels and alloys), 174-182

TOPIC TAGS: <sup>ALLOY PHASE DIAGRAM,</sup> gas discharge counter, scaler, count rate meter, exoelectron emission, electron emission, metal surface, tin, aluminum base alloy, phase composition / SI-2B gas discharge counter, PS-1000 scaler, ISS-3 count rate meter

ABSTRACT: The purpose of this project was to develop methods of investigating phase and structural transformations by means of exoelectron emission on using modern electronic apparatus. Tin, alloys of tin with lead (14, 38.1 and 94% Pb), alloys of aluminum with zinc (8 and 15% Zn), and sheet aluminum subjected to various degrees of deformation were thus in-

investigated. Specimens 1-2 mm thick and measuring from 20 to 250 mm<sup>2</sup> in area were placed on a mica sheet atop a hollow water-cooled steel base plate (Fig. 1).

Fig. 1. Schematic representation of the design of the base plate for a Geiger-Mueller counter

Card 2/4

ACC NR: AT6036427

The investigation was performed with the aid of a setup specially designed and constructed in the Moscow Institute of Aviation Technology and consisting of a SI-2B gas-discharge counter, a PS-10000 scaler, an ISS-3 counting rate meter, a tank for the preparation of the quenching mixture and a KhA thermocouple for measuring the specimen's temperature. The setup is equipped with a furnace for heating specimens to a temperature of 300°C. Findings: with heating of the specimen the number of pulses monotonically increased. On slow cooling of the specimen an emission peak corresponding to the crystallization temperature was recorded. In general, the very presence of an emission peak makes it possible to determine the temperature of phase transformations. With respect to Sn alloys the emission peaks at the instants of phase transformation were 22, 32 and 42 pulses/sec, respectively, which is in good agreement with theory (constitution diagram of Sn-Pb) and the experimental findings of Futschik et al. (Z. Physik, H. 145, Nr. 48, 1956). New experimental findings were obtained on the exoelectron emission of alloys of the Al-Zn system. In particular, the investigation of exoelectron emission in the presence of solid-state transformations of alloys with 8 and 15% Zn established complete correspondence between the position of emission peaks on the temperature axis with the line of limited solubility of Zn in Al in solid state. Further, it is established that the magnitude of the emission peak is independent of the thermal effects of the transformations. Hence the exoelectron emission method serves equally well to determine both the transformations from liquid to solid state and from solid to liquid state. Another new

Card 3/4

ACC NR: AT6036427

finding was that the rate of exoelectron emission from the surface of a metal is influenced by and commensurate with the degree of the metal's previous cold deformation. Thus the counting rate for specimens of sheet aluminum deformed 50% is roughly four times as high (20 pulses/sec) as the counting rate for specimens deformed 10% (~5 pulses/sec). It is thus clear that the exoelectron emission method represents a major new technique of metallographic investigation. Orig. art. has: 11 figures.

TITLE: A method for studying the fatigue strength of thin-walled hermetically sealed components. Class 42, No. 191180

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1967, 115

TOPIC TAGS: test facility, hermetic seal, fatigue strength

ABSTRACT: This Author's Certificate introduces a method for studying the fatigue strength of thin-walled hermetically sealed components on a test stand with a vacuum chamber using a registration device. The procedure is designed for determining the point where microscopic fatigue cracks begin to form and for studying the process of crack propagation. The part to be tested is placed in the vacuum chamber in such a way that the chamber is divided into two sections. The spaces above and below the specimen are evacuated and the upper space is then filled with a test gas such as helium. The part is loaded according to a predetermined law and the registration instrument (gas analyzer) is used for determining the increase in the quantity of test gas beneath the component due to the development of microscopic fatigue cracks in the given specimen during loading. The readings of the instrument are used for studying the process of appearance and propagation of microscopic fatigue cracks.

TITLE: Relationship between the temperature at the center of a sunspot and its area

SOURCE: Pulkovo. Astron. observ. Izvestiya, v. 23, no. 2(173), 1963, 47-56

TOPIC TAGS: sunspot, solar flacula, sunspot temperature, sunspot temperature area dependence, solar photometry, photoheliogram, solar brilliance sine Theta dependence

ABSTRACT: Photometric data obtained on sunspots since 1948 at the Gornaya astronomicheskaya stantsiya Glavnoy astronomicheskoy observatorii AN SSSR (Mountain Station, Central Astronomical Observatory AN SSSR) have been evaluated to determine the relationship between temperature and area. However, since the photoheliograms have been standardized daily only since Dec., 1960, a way of utilizing the older records was first developed. It was found that the phenomenon of decreasing solar brilliance toward the edge of the solar disk can be used effectively for standardizing photoheliograms. The procedure for correcting the observed data for image blur and light dispersion on the solar disk is described in detail. Given the effective wavelength, the temperature of the sunspot was determined by comparing the energy distribution in certain sections of its spectrum with that of the photosphere spectrum. As shown by Fig. 1 in the Enclosure, there was a definite relationship

Card 1/12

**RADIATION-INDUCED REACTION OF HEPTANE, NONANE, OR CUMENE WITH CO<sub>2</sub> (USSR)**

Kalyazin, Ye. P., and V. I. Makarov, *Neftekhimiya*, v. 3, no. 2, Mar-Apr 1963, 227-232.  
S/2G4/63/003/002/003/006

The reaction of n-heptane, n-nonane, or cumene with CO<sub>2</sub> was induced by x-radiation and γ-radiation from a Co source in order to study the effect of radiation intensity, temperature, and CO<sub>2</sub> concentration on the reaction. The reaction was carried out in sealed ampoules. The yield of acids, esters, and carbonyl compounds was found to be independent of γ-ray intensity in the range from  $3.8 \cdot 10^{16}$  to  $1.1 \cdot 10^{18}$  ev/ml-sec. The reaction showed no temperature dependence from -77 to +145°C. The radiation yield varied as a function of CO<sub>2</sub> concentration.

Card 1/2

AID Nr. 983-10 5 June

RADIATION-INDUCED REACTION (Cont.) 8/204/63/003/002/003/006

For  $\text{CO}_2$  concentrations from  $5 \cdot 10^{-4}$  to  $8.8 \text{ mol/l}$ , the maximum acid yield, 0.8, was at  $2 \text{ mol/l}$  of  $\text{CO}_2$ , and the maximum carbonyl-compound yield, 0.29 molecule/100 ev, at  $8.8 \text{ mol/l}$  of  $\text{CO}_2$ . The carbonyl compounds are assumed to result from the direct effect of radiation on the dissolved  $\text{CO}_2$ , which is in good agreement with their linear yield increase with increasing  $\text{CO}_2$  concentration. The work was done at the Moscow State University imeni M. V. Lomonosov.

AUTHOR: Makarov, V. I.; Polak, L. S.

TITLE: Radiolysis of cyclohexane. Effect of temperature and the aggregate state of cyclohexane.

SOURCE: Neftekhimiya, v. 4, no. 2, 1964, 314-319

TOPIC TAGS: cyclohexane, radiolysis, temperature effect, aggregate state, gaseous cyclohexane, liquid cyclohexane, solid cyclohexane, carbon hydrogen bond rupture, cyclohexene, dicyclohexyl, carbon carbon bond rupture, cyclopropane, monomolecular decomposition, excited cyclohexane

ABSTRACT: The effect of temperature and of the aggregate state of cyclohexane on the yield of its radiolysis products was investigated and explained. The yield of products formed by the rupture of the C-H bond (cyclohexene and dicyclohexyl) is independent of temperature in the -195C to +50C range (solid to liquid). The yield of hydrogen increased very slightly with increase in temperature. The yield of C<sub>1</sub> - C<sub>4</sub> products formed by the rupture of the C-C bond was determined at a dosage of  $3 \times 10^{19}$  electron volts/ml. The absolute value of the yields was

Card 1/62

ACCESSION NR: AP4032517

very small. The aggregate state, i.e., temperature does not affect the relative ratio of these products (methane, ethane, ethylene, propane and acetylene, compound a, propylene, n-butane, butene-1, butene-2 and butadiene), but significantly affects their yield (which is about 10 times greater in the gaseous than in the liquid phase). The compound a is a 3-carbon atom hydrocarbon which is neither allene nor propyne (possibly cyclopropane). Three possible types of monomolecular decomposition of the excited cyclohexane molecules and the "cage effect" are shown in figure 1 of the enclosure to explain the obtained results. "The authors thank Yu. A. Kolbanovsko for assistance in the work." Orig. art. has: 3 figures and 2 tables.

TITLE: Propagation of electromagnetic impulses and of their harmonic components above the surface of the earth

SOURCE: Leningrad. Universitet. Problemy\* difraktsii i rasprostraneniya voln. no. 3, 1964. Rasprostraneniye radiovoln (Radio wave propagation), no. 3, 5-191

TOPIC TAGS: radio wave, radio wave propagation, electromagnetic propagation, surface wave propagation, ionosphere, path attenuation

ABSTRACT: The article presents the results of computations of surface wave propagation path properties in the form of graphs and tables with emphasis on the spectral characteristics of the path. The variation in the conductivity and dielectric constant of the earth with frequency is neglected. The multipath character of ionospheric reflections is also neglected by assuming proper gating function at the receiver. In the theoretical section, formulas for the field of a vertical electric dipole, radiating CW energy above a homogeneous or multi-layer flat or spherical earth, are introduced, using the surface impedance approach. Refraction is taken into account by introducing the equivalent radius of the earth. The path

Card 1/4

ACCESSION NR: AT4043149

attenuation function  $V(x, y, q)$  for a spherical earth introduced by V. A. Fok (AN SSSR, 1946) is used. It is argued that the availability of tables of the attenuation function for a large number of frequencies enables one to compute the attenuation for an arbitrary signal modulation. After the singularities of the field at the imaginary axis of the complex frequency plane have been separated, a numerical integration method is proposed for evaluation of "transient" spectral components. Three specific examples are worked out in detail: unit step dipole current and sine and cosine dipole current modulated by a unit step function. The first set of curves gives the amplitude and phase as a function of range of the plane earth attenuation function  $W$  and spherical earth attenuation function  $V$  for ranges from 0-600 km, frequencies from 2 kc-10 mc, earth dielectric constants of 5, 10, 20 and 80 with corresponding conductivities of  $10^{-4}$ ,  $10^{-3}$ ,  $10^{-2}$  and  $1 \text{ (ohm} \cdot \text{m)}^{-1}$ . From these curves, a set of curves is generated which gives a plot of range as a function of frequency for constant percentage difference in amplitude and phase of  $W$  and  $V$ . This set of curves defines the conditions under which a spherical earth model must be used to achieve a prescribed accuracy. For the same set of surface conditions and frequencies the far field values of  $V$  (amplitude and phase) are then plotted for ranges up to 10,000 km. The next group of curves illustrates the frequency variation of the parameters  $t_1$ ,  $t_s$ ,  $t_2$  and  $q$  of Fok's

Card 2/4

ACCESSION NR: AT4043149

representation of the attenuation function  $V(x, y, q)$  as well as the convergence of the series expansion which was used in computation. Two sets of curves of  $W$  for transmitter elevations from 0-60 km are given for frequencies of 10-kc and 100 kc and  $\epsilon_m = 10$  and  $\sigma = 10^{-3} \text{ (ohm} \cdot \text{m)}^{-1}$ . Finally, plots of electric field components as functions of time for sine and cosine signals modulated by a step function are given. Tables 1-4 give the values of  $v$ ,  $\arg V$ ,  $\text{Re } V$  and  $\text{Im } V$  for ranges from 10-10,000 km and frequencies from 2 kc - 10 mc for the following combinations of the dielectric constant  $\epsilon_m$  and conductivity  $\sigma$ :  $\epsilon_m = 80$  and  $\sigma = 1 \text{ (ohm} \cdot \text{m)}^{-1}$ ,  $\epsilon_m = 20$  and  $\sigma = 10^{-2}$ ,  $\epsilon_m = 10$  and  $\sigma = 10^{-3}$ ,  $\epsilon_m = 5$ ,  $\sigma = 10^{-4}$ . Tables 5-8 give the values of the parameter  $t_s$  as  $\text{Re } t_s$ ,  $\text{Im } t_s$ ,  $|t_s|$  and  $\arg t_s$  for values of  $s$  from 1-10 and for frequencies from 2 kc-10 mc for the same combinations of  $\epsilon_m$  and  $\sigma$ . Finally, table 9 gives the value of the field for modulated signal for time  $t$  from  $10^{-3} - 35 \mu\text{sec}$  and for  $\epsilon_m = 20$ ,  $\sigma = 10^{-2}$  and  $\epsilon_m = 10$  and  $\sigma = 10^{-3}$  for a plane earth and for an earth of 2 layers, one of which is 50 meters thick. The range parameter extends from 10 to 800 km. Orig. art. has: 96 equations, 92 figures and 9 tables.

TITLE: Superconductivity of tin and indium under pressure

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki,  
v. 40, no. 2, 1967, 457-464

TEXT: In previous papers (ZhETF 11, 465, 914 and 18, 825, 1948), the authors described studies of the effect of pressure on the critical temperature of tin and indium at 100 and 1000 kg/cm<sup>2</sup>. They observed shifts ( $\Delta T_c$ ) of less than 0.1°. If  $dT_c/dp$  is assumed to proceed linearly, the following shift rates are obtained:  $0.1 \pm 0.2 \cdot 10^{-5}$  deg/atm for tin, and  $(-4.6 \pm 0.2) \cdot 10^{-5}$  deg/atm for indium. In recent times, the correctness of these values has been doubted. For this reason, the measurements were repeated in the range of from 0 to 1000 kg/cm<sup>2</sup>. For indium,  $T_c(p)$  was linear also in this range and it was found that  $dT_c/dp = (-4.4 \pm 0.3) \cdot 10^{-5}$  deg/atm (see solid line in Fig. 2). Tin, however, showed a linear

Card 1/43

20456

B102/B202

Superconductivity of tin ...

course of  $T_c(p)$  with  $dT_c/dp = 1.4 \pm 0.2 \text{ mK/deg/atm}$  in the range of from 0 to 100 atm. At higher temperatures, a deviation from linearity was observed (see Fig.2, dashed curve obtained from two tin specimens A and O; the dashed line corresponds to  $dT_c/dp = 5.7 \pm 0.2 \text{ mK/deg/atm}$ ). The measurements were made by the differential and the ice method (the latter in the range 500 to 1200 atm). In the range of from 800 to 1730 atm,  $dT_c/dp$  was  $4.6 \pm 0.2 \text{ mK/deg/atm}$ . Since this curve runs in parallel with the indium curve, it can be assumed that between 100 and 800 atm a transition takes place from one straight line to the other. The effect of pressure on superconductivity has hitherto not been fully explained. The new theory of superconductivity gives the relation  $T_c \sim \Theta \exp(-2/gv)$ , where  $\Theta$  is the Debye temperature,  $g$  the electron-phonon interaction constant, and  $v$  the electron density. Compression on all sides of the metals leads to an increase of  $\Theta$  and, thus, to a linear increase of  $T_c$ . To explain the course of  $T_c(p)$ , the pressure-dependent change of the electro-

nic properties of the metal must be studied. It is of interest that In with linear  $T_c(p)$  has a most simple Fermi surface (closed, almost spherical), whereas thallium (like tin) with its complex function  $T_c(p)$  has an anisotropic Fermi surface ("corrugated" planes). There are 2 figures and 8 references: 5 Soviet-bloc and 3 non-Soviet-bloc.

AUTHORS: Lazarev, B. G., Lazareva, L. S., Makarov, V. I.  
TITLE: Features of the pressure dependence of the critical temperature of thallium  
PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 44, no. 2, 1963, 481-482

TEXT: The pressure dependence of  $T_{cr}$  was measured for annealed single crystals of pure thallium ( $R_{4.20K}/R_{cr} \sim 2 \cdot 10^{-4}$ ) in the range from zero to  $1730 \text{ kg/cm}^2$ , and the curve obtained was completed with the help of data by Jennings and Swenson (Phys. Rev. 112, 31, 1958) and Bowel and Jones (Proc. Roy. Soc., 254, 522, 1960). The following were noted: linear increase of  $T_{cr}$  with  $p$  in the range  $0 - 1500 \text{ kg/cm}^2$  ( $dT_{cr}/dp = (0.4 \pm 0.1) \cdot 10^{-5} \text{ deg/atm}$ ; rapid increase between  $1500$  and  $1730 \text{ kg/cm}^2$ ; decrease at  $p > 1730 \text{ kg/cm}^2$ . This complex behavior is possibly connected with electron transitions in the conduction electron spectrum and could

Card 1/2

Features of the pressure ...

S/056/63/044/002/015/065  
3102/3186

be explained by changes of the Fermi surface topology. Taking into consideration the difference in electron-group state densities at the Fermi surface, where the lower state density corresponds to the higher electron-phonon interaction constant  $g \sim m^{-1/2}$ , the contribution of the small group ( $m_{\text{off}} = m_1$ ) is estimated. With  $\epsilon_1/\epsilon_2 = m_1/m_2$ , it is found that  $\epsilon_1$  could amount to  $\sim 10\%$  of  $\epsilon_2$ . There is 1 figure.

ference in pressure variation between thallium and other superconductors such as lead, indium, and aluminum. An impurity with valence lower than thallium (Hg, Cd) lowers  $T_c$ , while one with higher valence (Bi, Sb) raises it. Differences in the atomic radius likewise have a different effect on  $T_c$ . In this respect thallium is no different from other superconductors, and the impurities affect  $T_c$  in accordance with the differences in their electron free paths, valences, and atomic radii. Title: Visualization of Shear Ultrasonic Waves in Transparent Solid Bodies

Original

Periodical: Akust. zh., 1956, 2, No 2, 224-225

Abstract: Using a sensitive Tepler installation in (flint) glass blocks in nonpolarized light, the standing shear waves, excited by a Y-section quartz plate, was observed. At 805.6 kc the speed of the shear wave was 2,481 m/sec. The running shear waves were observed upon reflection of the longitudinal wave at the boundary between the glass and the air in the form of a light beam against the background of the interference of the reflected longitudinal and shear waves. Mueller (Mueller, H., Physics, 1935, 6, 179-184) has shown theoretically that the elastic stresses produce an

Abst Journal: Referat Zhur - Fizika, No 12, 1956, 35563

Abstract: anisotropy of the molecular refraction, changing as a result the coefficient of refraction. This leads to the possibility of the diffraction of light by shear waves, although indeed a weaker possibility than in the case of longitudinal waves. The possibility of visualizing shear waves without polarization optics is attributed to the greater sensitivity of the installation.

TITLE: Anomalies in the superconducting transition temperature under pressure

2/44, 55

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 48, no. 6, 1965, 1717-1722

TOPIC TAGS: thallium, superconductivity, pressure effect

ABSTRACT: This investigation was stimulated by the fact that thallium behaves under pressure in a manner different from other metals, and was aimed at checking the hypothesis that the nonlinear part of the pressure dependence of the transition temperature is connected with a change in the topology of the Fermi surface under pressure. The hypothesis is verified by starting out from a very simple model of superconductivity; the authors show that the change

Card 1/2

L 00563-66

ACCESSION NR: AP5016565

15

change in the topology of the Fermi surface is associated with the pressure-induced change in the Fermi energy, and compute the variation of the superconducting transition temperature with variation of this energy. The relative change of the transition temperature is found to be of the order of the square root of the ratio of the Debye temperature to the Fermi energy. The relation between the transition temperature and the impurity concentration is also investigated. "The authors thank A. I. Akhiezer, M. G. Lazarev, T. A. Ignat'yeva, and N. S.  85-89  
 TOPIC TAGS: thallium, mercury, mercury impurity, impurity effect, pressure effect,  
 Fermi surface, high pressure research  
 ABSTRACT: This is a continuation of an earlier study (ZhETF v. 48, 1065, 1965) of  
 the influence of impurities on the superconducting transition temperature of thal-  
 lium under pressure. In the present study, to check on some of the hypotheses ad-  
 vanced in the earlier paper, the authors extended the pressure range to 20,000 atm,  
 and measured the pressure effect in both pure and mercury-bearing thallium, using  
 the same thallium-mercury alloys as in the earlier work. Cylindrical samples of  
 2.5 mm diameter and 3-4 mm length were used, and the superconducting transition  
 was measured with a tin manometer and recorded by an induction method. The appa-  
 ratus and procedure employed were the same as described in detail elsewhere (PTB  
 no. 2, 131, 1960; PTZ v. 3, 3461, 1961), apart from slight modifications. It was  
 Card 1/2

L 62230-65

ACCESSION NR: AF5019219

2

found that at high pressures (20,000–28,000 atm) the dependence of the transition temperature ( $T_c$ ) on the pressure (P) was similar for the mercury-bearing and pure thallium, but different at low pressures (up to approximately 7000 atm), with the sign of the effect reversing at a concentration ~ 0.9% Th. It is suggested that this behavior of thallium and its alloys is related to the characteristic features of the pressure dependence of the density of states on the Fermi surface. In particular, the results confirm hypotheses advanced in the earlier paper, that thallium has two components in the pressure dependence of  $T_c$ , linear and nonlinear, and that the impurity content affects mainly the nonlinear component. It is possible that the impurity dependence affects the Fermi-surface topology of thallium. Orig. art. has: 3 figures. (02)

TITLE: Effect of impurities on the superconducting transition  
temperature

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 49,  
no. 6, 1965, 1858-1867

TOPIC TAGS: superconductivity, phase transition, impurity scatter-  
ing, critical point, electron interaction

ABSTRACT: The authors investigate the effect of diamagnetic impuri-  
ties on the superconducting transition temperature for the case when  
addition of impurities makes it possible to modify the topology of  
the Fermi surface of the superconductor. This is done by determining  
the nonlinear change in the temperature  $T_k$  ( $\sim \sqrt{n} \ln n$ , where  $n$  is the

Card 1/2

21,44,55

2

L 17655-66

ACC NR: AP6002728

4  
impurity density) of the superconducting transition with change in the Fermi-surface topology. It is assumed that the anisotropy of the electron-electron interaction is small and only the nonlinear change in  $T_k$  under the influence of the impurities, due to modification of the Fermi-surface topology is considered. It is shown that this mechanism, unlike that considered by D. Markowitz and L. P. Kadanoff (Phys. Rev. v. 131, 563, 1963) may lead to both a nonlinear decrease and a nonlinear increase of  $T_k$  with increasing impurity concentration.

The expression derived for  $T_k$  consists of the value of  $T_k$  for the pure semiconductor, plus a term which allows for the combined effect of the singularities in the topology of the Fermi surface and the scattering of the electrons by the impurities. Author thanks A. I. Akhiezer, I. A. Akhiezer, I. M. Lifshits, and G. M. Eliashberg for a discussion of the work. Orig. art. has: 1 figure and 41 formulas.

 TITLE: On the change of the topology of the Fermi surface in thallium under the influence of impurities  
 SOURCE: AN USSR. Doklady, v. 163, no. 1, 1965, 74-75  
 TOPIC TAGS: superconductivity, thallium, impurity effect  
 ABSTRACT: The authors observed experimentally a singular behavior in the temperature of the superconducting transition ( $T_c$ ) of thallium (change in the number of valleys on the Fermi surface) in investigations of the influence of impurities on the pressure dependence of  $T_c$ . The study was made by investigating the joint influence of impurities of different valences and of the pressure on  $T_c$  of thallium. The results show that the impurities whose valence is larger than that of thallium (Bi) decrease the positive pressure effect with increasing concentration, causing the pressure to become negative starting with a certain value of the concentration (0.2 at.%). In the case of an impurity of lower valence (Hg), the positive pressure effect increases at low concentrations. With further increase of the concentration, the positive effect decreases and becomes negative at ~0.9 at.% Hg. The

TITLE: Concerning the influence of pressure on the temperature of the superconducting transition

SOURCE: AN UkrSSR. Fiziko-tehnicheskii institut. Doklady, no. 244/T-029, 1965. K voprosu o vliyaniy davleniya na temperaturu sverkhprovodyashchego perekhoda, 1-6

TOPIC TAGS: superconductivity, phase transition, critical point, critical magnetic field, pressure effect, conduction electron, crystal lattice

ABSTRACT: In view of the lack of a theoretical explanation for the fact that in some superconductors the temperature of the superconducting transition  $T_k$  increases under pressure and in others it decreases, the authors use the already-known expression for  $T_k$  to determine an expression for the derivative of  $T_k$  with respect to pressure in terms of the experimentally observed quantities, namely the Gruneisen constants of the electrons and of the lattice and the coefficient of compressibility of the metal. The values obtained for this derivative theoretical-

Card 1/2

L 27467-66

ACC NR: AT6008418

ly are compared with the experimental values for Al, In, Pb, Hg, Sn, Cd, Zn, La, Nb, Ta, V, Zr, and Mo and are found to be in satisfactory agreement with experiment. An expression is also given for the derivative of the critical magnetic field with respect to the pressure in terms of the Gruneisen constants and the compressibility. This makes it possible to calculate the sign and magnitude of this derivative for different metals and compare them with the experimental values. These too are found to be in fair agreement. A certain anomaly in the case of thallium in the region of pressures up to 6000 atm is probably connected with singularities of the energy spectrum of the conduction electrons. The values for Ga, Re, Ru, Th, and Ti could not be compared with experiment for lack of the Gruneisen constants. The authors thank B. G. Lazarev for a discussion of the work. TITLE: Effect of impurities on the topology of the Fermi surface of indium

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu.  
Prilozheniye, v. 4, no. 9, 1966, 369-372

TOPIC TAGS: indium, critical temperature, pressure effect, Fermi surface

ABSTRACT: The authors report the results of an investigation of the effect of Cd impurity on the behavior of the transition temperature ( $T_c$ ) of In under pressure, carrying out the measurements on In-Cd solid solutions with up to 4.5 at.% Cd. The method of producing the solid solutions is described. The investigated solutions were sufficiently homogeneous, as evidenced by the small difference between the widths of the superconducting transitions of the pure In ( $2 \times 10^{-3}$  °K) and of the samples ( $2 - 5 \times 10^{-3}$  °K). The plot of the superconducting transition under pressure was similar to that without pressure. The pressure was produced by an "ice" technique. The shift of the transition temperature  $T_c$  from the residual resistance without and with pressure was measured relative to  $T_c$  of a pure indium sample in one experiment. In the pressure interval 0 - 1730 kg/cm<sup>2</sup>, a linear decrease of the superconducting-transition temperature was observed for both the In-Cd alloys and the pure In. The changes in

Card 1/2

L 11388-67

ACC NR: AP7000400

the topology of the Fermi surface of indium are deduced from the dependence of the pressure effect of the investigated alloys on the residual resistance. It is pointed out that a similar variation of the pressure dependence of the transition temperature with change in impurity concentration can be observed also for Al, which has an electronic structure similar to In. This follows from observation of the de Haas - van Alphen effect in Al with Zn impurity. The authors thank B. G. Lazarev, V. G. Bar'yakhtar, I. V. Svehkarev, and T. A. Ignat'yeva for useful discussions. Orig. art. has: 2 figures.

TITLE: Thermodynamic and static methods of studying ultrasonic cavitation

SOURCE: Ukraine. Ministerstvo vysshego i srednego spetsial'nogo obrazovaniya. Mezhdovedstvennyy respublikanskiy nauchno-tekhnicheskiiy sbornik, 1966. Akustika i ul'trazvuk (Acoustics and ultrasonics), no. 1, 5-21

TOPIC TAGS: ultrasonic vibration, liquid state, cavitation, thermodynamic analysis, nucleate boiling, boiling point, temperature dependence, pressure dependence

ABSTRACT: A theoretical analysis of ultrasonic cavitation was made and experiments were conducted on acoustical measurements under cavitation conditions. An equation for the critical radius of a gas nucleus ( $R^*$ ) forming in liquids under metastable thermodynamic conditions was obtained by differentiating the total free energy of a system, in which the surface free energy is given by  $4\pi\sigma R^2$ . The number of bubbles having a radii equal to  $R^*$  is given by

$$N(g^*) = C \exp (-4\pi\sigma R^{*2}/3kT).$$

Card 1/3

L 10083-67

ACC NR: AT6026363

The constant  $C = v_{liq} x / v_A$ , where  $v_{liq}$  is the volume of the liquid,  $v_A$  is the molecular volume, and  $x$  is the molal gas content in the liquid phase. An equation is also given for the total volume of gas nuclei ( $V_k$ ) formed during cavitation at a frequency of 20 Kc in the temperature range 10-60°C, for different molal air contents ( $x$ ) dissolved in water. Experimental results showed that cavitation was highly dependent on the gas content of the liquid. With increase in temperature, the value of  $x$  had a lower effect on  $V_k$ . The value of  $V_k$  was proportional to the nucleation rate while the maximum cavitation pressure was proportional to  $T^{-3}$  where  $T$  is the absolute temperature of the liquid. High speed motion pictures were made of the cavitation process. At 24 Kc, the diameter of the cavitation bubbles went through a maximum as a function of oscillation time. This change was caused by the rise in surface tension due to vapor formation. Measurements of cavitation impulse pressure were dependent on hydrophone design. Oscillographic measurements of cavitation impulses peaked strongly at the maximum amplitudes of the free oscillations (1.2 and 3 Mc). A special thermostat was used to obtain the temperature dependence of the maximum amplitude of cavitation impulses during heating and cooling. Simultaneously, aluminum samples were tested for cavitation erosion. The strongest maxima were observed at 60°C upon heating and cooling, while some strengthening occurred after cooling below 40°C. Erosion was directly proportional to the cavitation pressure. Further tests showed that by maintaining the temperature at 80°C for 2-3 hr the cavitation action became strongest at room temperature due to lowered gas

content. Under atmospheric pressure and at 20°C the maximum impulse amplitude occurred at a volume ratio of air to water of 0.0145. Orig. art. has: 9 figures, 1 table, 21 formulas.

**COVERAGE:** The book, consisting of eight chapters, presents an account of the development and application of modern experimental methods of investigating textile machinery. The first chapter deals with general considerations of method, while the second presents information on electrical methods of measuring nonelectrical quantities, on transducers and their connecting circuits, on recording devices, and on electrical and radio equipment. Methods of determining parameters of parts being subjected to experimental study are described in Chapter III. The fourth chapter deals with the determination of displacements, speeds, and accelerations of given points in machine parts. Chapter V describes methods of measuring tension in a single thread as well as in a group of threads under varying operating conditions. Measurements of power, forces, moments, stresses, and deformations are also discussed. Ch. VI presents methods of measuring vibrations in machine parts, while Chapter VII deals with methods and equipment for dynamic balancing of rotating parts. Chapter VIII describes special stands and equipment for testing the performance of textile-machinery units. Most of the testing equipment described in the book was developed by VNIITKhmash. The following organizations are presently engaged in the development of instruments and installations for investigating and testing textile machinery, parts, and subassemblies: The Moskovskiy, Leningradskiy, Ivanovskiy i Kostromskoy uchebnyye tekstil'nyye instituty (Moscow, Leningrad, Ivanovo, and Kostroma Textile Institutes of Higher Education); the TsNKhBI,
